Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Anode Materials for Li-Ion Battery competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The anode is the negative electrode of a primary cell and is always associated with the oxidation or the release of electrons into the external circuit. In a rechargeable cell, the anode is the negative pole during discharge and the positive pole during charge. The vast majority of lithium-ion batteries use graphite powder as an anode material. Graphite materials are either synthetically-produced (artificial graphite) or mined from the ground (natural graphite), then heavily processed before being baked onto a copper foil to serve as anodes. The market drivers for lithium-ion battery anode materials are primarily driven by the rapid growth of the electric vehicle (EV) industry, increasing demand for energy storage systems, technological advancements, and supportive government policies. As the global EV market continues to expand, there is a growing need for high-energy-density and long-life batteries, which in turn drives demand for high-performance anode materials such as graphite, silicon-based anodes, hard carbon, and soft carbon. The deployment of energy storage systems for renewable energy integration, grid stabilization, and residential storage further expands the demand for anode materials. Technological innovations have improved material capacity, cycle life, and safety performance, optimizing overall lithium-ion battery performance and supporting broader adoption of EVs and energy storage devices. At the same time, government incentives for EV promotion, carbon reduction, and renewable energy storage provide strong support for the anode materials industry. The market's pursuit of higher energy density, fast-charging capability, and cost-effective solutions also drives continuous development of new anode materials to meet growing demand. Global key players of anode materials for Li-Ion battery include BTR, Shanghai

Putailai (Jiangxi Zichen), etc. Global top 3 companies hold a share over 40%. China is the largest market, with a share over 70%, followed by Japan with the share about 20%. In terms of product, artificial graphite is the largest segment, with a share over 80%. And in terms of application, the largest application is automotive, with a share about 60%.

The global Anode Materials for Li-Ion Battery market size was estimated at USD 6711.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.20% during the forecast period.
