## Abstracts

Anodized aluminum sheet and coil are important types of aluminum processing products, and there are certain differences in surface quality and structure, thickness and shape. Anodized aluminum sheet is obtained by placing aluminum sheet in the corresponding electrolyte (such as sulfuric acid, chromic acid, oxalic acid, etc.) as an anode and electrolyzing it under specific conditions and external current. Anodized aluminum coil is made by adding different alloys to the melted aluminum ingot, and then processed by casting or hot rolling, cold rolling, annealing, cross-cutting and other processes. Anodized aluminum sheet and coil have good hardness, wear resistance, heat resistance, insulation, corrosion resistance, and aesthetics. They are widely used in mechanical parts, aircraft and automobile parts, precision instruments and radio equipment, architectural decoration, machine housing, lamps and lanterns, electronic consumer products, handicrafts, household appliances and other industries.

The global Anodized Aluminum Sheet and Coil market size was estimated at USD 872.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
