Abstracts

The antenna feed system is the cable or conductor, and other associated equipment, which connects the transmitter or receiver with the antenna and makes the two devices compatible. In a radio transmitter, the transmitter generates an alternating current of radio frequency, and the feed system feeds the current to the antenna, which converts the power in the current to radio waves. In a radio receiver, the incoming radio waves excite tiny alternating currents in the antenna, and the feed system delivers this current to the receiver, which processes the signal.

The global Antenna Feeder System market size was estimated at USD 2258.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
