Report Overview

Antenna Tuning Switch is composed of radio frequency switch, bias circuit and digital control circuit. The core of the design is to realize the switch of low on-state resistance R_{on} and low off-state capacitance C_{off} to minimize system loss. Therefore, the use of process characteristics is the tuning switch design. An important idea for optimization, the current mainstream process is the RF SOI process. At the same time, a single antenna tuning switch needs to use the communication frequency range of 2G/3G/4G/5G, so multiple RF switches are required. Currently, the mainstream application types are SP4T and DP4T. Antenna Tuning Switch and ordinary RF switches have RF circuits and control circuits, as well as the same performance parameters, such as power, insertion loss, isolation, harmonics and other parameters. In addition, the tuner switch also has withstand voltage, C_{off} (off-state capacitance), R_{on} (on-state resistance) performance parameters. It can be said that the tuner switch is a more advanced switch than ordinary RF switches.

The global Antenna Tuning Switch market size was estimated at USD 1070 million in 2023 and is projected to reach USD 2896.43 million by 2032, exhibiting a CAGR of 11.70% during the forecast period.

North America Antenna Tuning Switch market size was estimated at USD 337.54 million in 2023, at a CAGR of 10.03% during the forecast period of 2024 through 2032.
