Abstracts

Anti-blocking agents for film are specialized additives incorporated into polymer films during manufacturing to prevent adjacent layers from adhering to each other during storage, transport, or processing, thereby maintaining film integrity and usability. These agents function primarily by creating micro-roughness on the film surface or through chemical incompatibility, reducing the contact area and minimizing adhesive forces. Commonly used materials include inorganic particulates like silica, talc, or diatomaceous earth, as well as organic additives such as waxes, fatty acid amides, or polymeric microspheres. Their performance depends on factors like particle size, concentration, dispersion quality, and compatibility with the base polymer, with formulations tailored for specific film types such as polyethylene, polypropylene, or PVC and applications ranging from food packaging and agricultural films to industrial wraps.

The global Anti Blocking Agent For Film market size was estimated at USD 182.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
