Abstracts

Anti coincidence detectors are specialized electronic devices used in radiation detection and measurement systems, particularly in fields like nuclear physics, medical imaging (such as PET scanners), and high-energy physics experiments; they function by identifying and filtering out simultaneous signals from multiple detectors that occur within a very narrow time window, thereby reducing background noise and false counts by ensuring only non-coincident events?those that are not temporally correlated?are recorded, which enhances the accuracy and reliability of data in applications where precise timing and event discrimination are critical.

The global Anti Coincidence Detector market size was estimated at USD 45.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
