Report Overview

Epilepsy is associated with disrupted activities in the brain called seizures, which affects the central nervous system. Depending on the area of the brain obstructed by seizures, these are categorized into generalized seizures and partial seizures. Generalized seizures affect the whole brain, while partial seizures affect just one part of the brain. Depending on their severity, seizures are termed as mild seizures and stronger seizures. Mild seizures are difficult to diagnose, as these last for only a few seconds. Stronger seizures may last for a few seconds to a few or several minutes, resulting in spasms and uncontrollable muscle twitches. This may cause the patient to lose consciousness, lead to temporary loss of cognition, or memory loss during the seizure. Pediatric epilepsy can be caused due to a trauma injury, complications during birth, or genetic disorder. Epilepsy that occurs due to brain infections such as meningitis is known as symptomatic epilepsy, while genetics related condition is called idiopathic epilepsy.
