Abstracts

Anti-fog gel for glasses is a specialized optical accessory product designed to prevent lens fogging caused by temperature or humidity changes by applying a thin, transparent surfactant-based coating that alters surface tension to disperse moisture evenly rather than allowing it to form obstructive droplets. These formulations typically include hydrophilic polymers or compounds like surfactants and glycerin that create a temporary barrier, maintaining visual clarity in conditions such as moving between indoor and outdoor environments, wearing masks, or engaging in sports and activities involving steam or sweat. The product is applied directly to lenses, then gently wiped or buffed to leave an invisible layer that resists fogging for several hours to days depending on the brand and environmental factors.

The global Anti Fog Gel For Glasses market size was estimated at USD 180.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
