Report Overview

Anti-fouling anodes are special anodes used to prevent the attachment and growth of marine organisms on the hulls of ships, offshore platforms or other underwater installations. It is an auxiliary anode that is used in conjunction with the main anode for effective cathodic protection. Antifouling anodes are usually made of zinc, aluminum, copper and other materials. Through special alloy formula and structural design, they have good electrochemical properties and anti-marine biological adhesion properties in the electrolyte. When used, the antifouling anode is installed at a specific location of the underwater facility, such as the bottom of the hull, ocean platform, etc., and is connected to the external power supply through a connecting cable to provide the necessary cathodic protection current.
