### Report Overview

Anti-HER2 Therapy is a class of medicines used to treat all stages of HER2-positive breast cancer and certain HER2-low breast cancers. In HER2-positive breast cancer, the HER2 (human epidermal growth factor receptor 2) gene doesn't work correctly and makes too many copies of itself. These extra HER2 genes make too many proteins known as HER2 receptors. Anti-HER2 medicines attach to the HER2 receptor proteins on the surface of breast cancer cells. Anti-HER2 medicines work by blocking the HER2 receptors from receiving the growth signals in HER2-positive breast cancer. By blocking the growth signals, anti-HER2 medicines can slow or stop the growth of HER2-positive and HER2-low breast cancer. Anti-HER2 medicines only work on HER2-positive and HER2-low breast cancer. They do not work on HER2-negative breast cancer.

The global Anti-HER2 Therapy market size was estimated at USD 5690 million in 2023 and is projected to reach USD 8455.88 million by 2032, exhibiting a CAGR of 4.50% during the forecast period.
