Abstracts

Anti-inflammatory drugs for dental use are medications designed to reduce inflammation and alleviate pain associated with dental conditions, such as toothaches, gum disease, or post-operative discomfort. Common classes include nonsteroidal anti-inflammatory drugs (NSAIDs) like ibuprofen and naproxen, which work by inhibiting enzymes that contribute to inflammation. These medications help manage pain and swelling, making dental procedures more tolerable. In some cases, corticosteroids may be prescribed to address more severe inflammation. Proper use of anti-inflammatory drugs can enhance recovery and improve overall oral health outcomes in patients undergoing dental treatment. Market demand for dental anti-inflammatory drugs is primarily driven by the high incidence of oral diseases, rising public awareness of oral health, and advances in dental diagnosis and treatment technologies. With the continued global prevalence of inflammatory diseases such as caries, periodontitis, and pericoronitis of wisdom teeth, patients urgently need quick relief from pain, swelling, and other discomfort symptoms, driving the widespread use of nonsteroidal anti-inflammatory drugs (NSAIDs) and topical anti-inflammatory preparations. Furthermore, a growing public awareness of the connection between oral health and overall health is prompting more people to seek professional treatment, expanding the scope of drug use.

The global Anti-inflammatory Drugs for Dental market size was estimated at USD 1166.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
