## Abstracts

As electronic equipment is developing towards miniaturization and lightweight while improving performance, product integration is getting higher and higher, and the line width and line spacing of FPC are getting smaller and smaller. When FPC works in a high temperature and high humidity environment, conductive dendrites are easily formed between fine lines, reducing the insulation reliability between lines and even causing FPC short circuit failure. Electrochemical corrosion of electronic product components caused by ion migration has become the most serious quality problem of downstream FPC factories in recent years. Improving the ion migration resistance of PCB substrates has become an urgent need in the development of electronic products. Anti-ion migration covering layers have excellent insulation resistance under high temperature and high humidity and are widely used.

The global Anti Ion Migration Coverlay For Fpc market size was estimated at USD 127.72 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
