Report Overview

The anti-lock braking system wheel speed sensor is an important component used to measure wheel speed and transmit its signal to the vehicle's electronically controlled braking system. ABS wheel speed sensors are usually installed on the wheels and detect the speed of the wheels by sensing a rotating magnetic field. ABS wheel speed sensors are generally composed of magnets, induction coils and signal conversion circuits. When the wheel rotates, the magnet will produce changes in the magnetic field. The induction coil converts these changes into electrical signals. The electrical signals are converted into digital signals through a signal conversion circuit, and then passed to the vehicle's electronically controlled braking system for processing.
