Abstracts

An Anti-Missile Defense System is a comprehensive framework designed to detect, track, intercept, and neutralize incoming missile threats, including ballistic, cruise, and hypersonic missiles. These systems integrate advanced radar technologies, satellite tracking, command-and-control units, and interceptor missiles to provide layered protection for strategic assets, military installations, and civilian areas. Key components often include early warning sensors, mid-course interception technologies, and terminal-phase defenses, ensuring multi-stage engagement capabilities. Amid global geopolitical tensions, the development of Integrated Air and Missile Defense (IAMD) has become a priority for major nations, with continuous efforts to develop and refine their respective systems to address evolving threats. Countries are investing in advanced technologies, such as multi-layered defense architectures, AI-powered threat detection, and hypersonic missile countermeasures, to enhance their strategic capabilities. This drive reflects a combination of national security needs and the competitive nature of defense innovation, as nations aim to maintain technological superiority while preparing for potential conflicts in an increasingly volatile global landscape. Under the influence of arms control, Integrated Air and Missile Defense (IAMD) is trending toward greater emphasis on defensive, rather than offensive, capabilities, with a focus on compliance, transparency, and technological precision. Arms control agreements encourage the development of IAMD systems that prioritize multi-layered protection to deter potential threats without escalating offensive capacities. For example, the deployment of systems like Aegis Ashore has raised concerns among some nations about potential violations of the INF Treaty (now defunct), as these systems could be repurposed for offensive capabilities. Similarly, integrating advanced missile defense systems into regions like Eastern Europe or East Asia can escalate tensions, as adversaries may view them as a threat to strategic stability, complicating disarmament talks and arms control negotiations. Sufficient funds for future markets As technology has yet to break through,

there are still no reliable and effective anti-missile systems to counter intercontinental ballistic missiles (ICBMs), for example. The Patriot and SAD missile defence systems, which are designed to counter short-range missiles, have had greater success in testing, but their utility is limited to a relatively small area of coverage. From a development standpoint, there will continue to be enormous amounts of public money invested in this category in the future, thus Integrated Air and Missile Defence has a positive market ahead of it. "Integration" degree gradually increased Existing air defense and anti-missile most of the single operation, which is a complex and diverse reality of the threat, there are certain deficiencies, some enterprises have been realized in the existing air defense and anti-missile system based on the joint operation, through the combination of traditional aerodynamic targets and ballistic missiles, hypersonic weapons, to build a more complete and comprehensive Integrated Air and Missile Defense. Such as the Russian S-500 missile system and the U.S. military based on the Aegis Combat System, etc. as well as France, Italy, the United Kingdom and other countries equipped with the Aster air defence The Aster missiles can defend against supersonic anti-ship missiles, warplanes, ballistic missiles and other capabilities, and are still being upgraded.

The global Anti-missile Defense System market size was estimated at USD 26550.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
