Report Overview

Anti-shock trousers are self-contained units, which are made of one abdominal section and two leg sections attached to an inflation unit. Medical anti-shock trousers restore blood pressure, particularly the central circulation by returning blood from the lower body. The design of an anti-shock trouser makes it easy to wear for a patient, and avoids the chances of side effects due to over inflation. Pneumatic medical anti-shock trousers are widely encouraged by the hospital management for trauma victims. The device is reusable, which makes it attractive for the application in emerging economies. The device is comfortable even with prolonged use of the device at low pressures. Military anti-shock trouser is one of the most widely used medical devices in pre-hospital care. The use of trouser should be based on the type of injury as well as the type of shock.
