Abstracts

An Anti-thrombogenic Coating is a specialized surface treatment applied to medical devices, such as catheters, stents, and heart valves, to reduce the risk of blood clot formation (thrombosis). These coatings are designed to enhance biocompatibility by minimizing platelet adhesion and activation, which are key factors in clot development. They often incorporate materials like heparin, polymer hydrogels, or nitric oxide-releasing agents that mimic the natural properties of blood vessel linings. Anti-thrombogenic coatings are crucial in improving the safety and effectiveness of medical implants and devices used in cardiovascular and vascular treatments, significantly lowering the risk of complications such as blockages or device failure.

The global Anti-thrombogenic Coatings market size was estimated at USD 1345.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
