Report Overview

Anti-VEGF (vascular endothelial growth factor) drugs are a class of therapeutics designed to inhibit the activity of VEGF, a protein that stimulates the growth of blood vessels. These drugs are primarily used to treat conditions characterized by abnormal blood vessel formation, such as age-related macular degeneration (AMD), diabetic retinopathy, and certain cancers. By blocking VEGF, these medications reduce vascular permeability and angiogenesis, slowing disease progression and preserving vision in ocular conditions or inhibiting tumor growth in oncology. The market for anti-VEGF drugs is driven by the increasing prevalence of chronic diseases like diabetes and AMD, advancements in biologic drug development, and the growing adoption of intravitreal injections for ophthalmic treatments. Key players include Roche (Lucentis), Regeneron (Eylea), and Novartis (Beovu), with biosimilars and next-generation therapies emerging as competitive factors. Pricing pressures, regulatory hurdles, and the need for frequent administration pose challenges, but the expansion of indications and improved drug delivery systems present significant growth opportunities. The market is expected to grow steadily, supported by aging populations and rising healthcare expenditure in both developed and emerging economies.

The global Anti Vegf Drug market size was estimated at USD 2586.29 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.72% during the forecast period.
