Abstracts

Peptide or antibody masking technologies are designed to keep an antibody inactive (masked) in circulation and allow it to bind its target only after it reaches a protease-rich disease site (usually the tumour microenvironment). This concept addresses on-target, off-tumour toxicity for therapeutic antibodies and forms the basis of several proprietary platforms such as CytomX's Probody, Adagene's SAFEbody, Janux's TRACTr/TRAClr, Vir/Amunix's PROXTEN, Zymeworks' ProTECT, Xilio's masked T cell engagers, and others. These platforms are still in early commercialisation and no marketed product yet uses peptide masking; however, the increasing number of high-value licensing deals and the broader growth in biologics and antibody drug conjugates (ADCs) provide insight into the commercial potential of this technology. Peptide/antibody masking technologies represent a promising next-generation platform for antibody therapeutics. Licensing deals show that pharmaceutical partners are willing to pay upfront fees in the tens of millions of dollars and offer milestone payments that can exceed half a billion dollars per program, with tiered royalties on commercial sale.

The global Antibody Masking Technology market size was estimated at USD 98.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 23.50% during the forecast period.
