Abstracts

Anticavity Fluoride Mouthwash is a type of oral hygiene product designed to help prevent tooth decay and strengthen enamel. It contains fluoride, a mineral that has been proven to reduce the risk of cavities by promoting remineralization, which helps restore minerals to weakened enamel. This type of mouthwash is typically used in addition to regular brushing and flossing to provide extra protection against tooth decay, particularly in individuals who are at higher risk for cavities. The fluoride in the mouthwash helps to neutralize acids produced by bacteria in the mouth, making it harder for plaque to form and reducing the chances of cavities developing. Some formulations may also include antibacterial agents to combat bad breath and reduce plaque buildup.
