Abstracts

Antidiabetic sulphonylureas are a class of oral hypoglycemic agents used primarily in the management of type 2 diabetes, functioning by stimulating insulin secretion from pancreatic beta cells through the inhibition of ATP-sensitive potassium channels; these drugs, which include medications such as glimepiride, gliclazide, and glibenclamide, are characterized by their efficacy in lowering blood glucose levels but carry risks such as hypoglycemia and weight gain, placing them within the broader context of type 2 diabetes therapeutics where they often serve as second-line treatments or are used in combination with other antidiabetic agents.
