### Report Overview

The antifouling agent utilizes its strong osmotic action, does not form a film on the surface layer, penetrates into the internal micropores, and forms a nanoscopic spherical crystalline curing layer, which can excellently prevent the entry of various water pollutants without affecting the color of the substrate. And permeability, to avoid the substrate caused by moisture retention inside the substrate lesions; dust and pollution can only float on the substrate surface, easy to clean. Waterproof and anti-fouling protection agent has strong penetration and plays a full protective role on the ground of buildings.

Fouling damages the body of the ship and decreases maneuverability which further leads to safety hazards. Therefore, coating shipping vessels with antifouling agents enhances not only the strength but also the overall performance of the vessels. These agents improve vessel performance by inhibiting the growth of sub-aquatic organisms on the underwater surfaces of the same. Commercial ships are generally coated with synthetic chemical compound paints. These chemical paints have adverse environmental effects. Rising ecological concerns are fuelling the need for biologically derived eco-friendly antifouling options. These may provide biomimetic and natural antifouling coatings. Biomimetics are expected to spur newer innovations in non-toxic options.
