Abstracts

Antifriction cast iron refers to a specialized class of cast iron alloys engineered to minimize friction and wear in mechanical applications, typically achieved through microstructural modifications such as the uniform dispersion of graphite flakes or spheroids within a ferrous matrix, often enhanced with alloying elements like copper, chromium, or molybdenum to improve hardness, thermal stability, and load-bearing capacity without external lubrication. This material is primarily utilized in components subject to sliding or rotating contact?such as bearings, bushings, piston rings, and machine tool slides?where its self-lubricating properties, durability, and cost-effectiveness compared to non-ferrous alternatives make it a critical material in heavy machinery, automotive systems, and industrial equipment manufacturing.

The global Antifriction Cast Iron market size was estimated at USD 1550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
