## Abstracts

Fungal tinea drugs, also known as fungal drugs for lichen diseases, are drugs used to treat skin tinea diseases caused by fungal infections. Fungal infections usually cause symptoms such as erythema, desquamation, itching, and cracking on the skin. Common diseases include athlete's foot, tinea versicolor, tinea corporis, tinea cruris, and tinea manuum. Fungal infections may be caused by different types of fungi. Antifungal drugs can inhibit or kill these fungi and help treat and relieve symptoms. Currently, commonly used topical antifungal drugs in clinical practice can be divided into imidazoles, allylamines, and other antifungal drugs. Imidazole antifungal drugs include clotrimazole, econazole, miconazole, ketoconazole, etc. Allylamine antifungal drugs include naftifine, terbinafine, and butenafine. Other antifungal drugs include amorolfine, ciclopirox olamine, liranaphate, etc. There are various types of fungal tinea drugs, including topical drugs and oral drugs. Topical drugs include antifungal creams, sprays, lotions, patches, etc., which are usually used for local treatment of fungal infections of the skin. Oral drugs are mainly used to treat extensive or stubborn fungal infections, such as itraconazole and fluconazole, which have strong systemic therapeutic effects. With the segmentation of treatment needs, some new drug forms, such as long-acting sprays and topical application formulations, have gradually gained market favor and met the treatment needs of different patients. With the advancement of science and technology, the research and development of fungal tinea drugs around the world has gradually developed towards innovation and efficient treatment. The new generation of antifungal drugs can not only improve the treatment effect, but also optimize the side effects. For example, some new drugs can reduce the risk of liver damage and solve the problem of side effects that may be caused by traditional drugs during long-term use. In addition, the course of treatment and the way of use of drugs are also gradually improving. Many new drugs use more convenient dosage forms and shorter treatment cycles, which are more attractive in the market. The global market demand for fungal tinea drugs varies in

different regions. The markets in developed countries and regions are relatively mature, with higher drug prices and a higher degree of standardized treatment. In developing countries, however, due to the limitations of economic level and medical resources, low-priced generic drugs and basic treatment methods dominate the market. In these regions, despite the higher rates of fungal infections, the popularity and use of drugs are affected. Therefore, global pharmaceutical companies need to consider the differences in demand in different regions when making global layouts and adjust their pricing and market strategies.

The global Antifungal and Ringworm Treatment Drugs market size was estimated at USD 3542.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
