Report Overview:

A catheter is a soft hollow tube, which is passed into the bladder to drain urine. Catheters are sometimes necessary for people, who for a variety of reasons, cannot empty their bladder in the usual way, i.e. passing urine into a toilet or urinal. This report mainly studies Antibiotic Coating Catheters and Silver Coating Catheters.

Antimicrobial catheters refer to catheters coated or infiltrated with antibacterial drugs, disinfectants, and metal-containing preparations. Anti-infective substances may coat the catheter, or attach to the catheter by chemical bonding. The anti-infection principle of the catheter is that when the catheter is exposed to blood, body fluids or other liquids, the anti-infective substance will be released around the catheter to form an anti-infective environment to resist microorganisms, thereby preventing the propagation and migration of bacteria colonizing the catheter.

The Global Antimicrobial Catheter Market Size was estimated at USD 1245.61 million in 2023 and is projected to reach USD 1869.32 million by 2029, exhibiting a CAGR of 7.00% during the forecast period.
