Report Overview:

Antimicrobial catheters refer to catheters coated or infiltrated with antibacterial drugs, disinfectants, and metal-containing preparations. Anti-infective substances may coat the catheter, or attach to the catheter by chemical bonding. The anti-infection principle of the catheter is that when the catheter is exposed to blood, body fluids or other liquids, the anti-infective substance will be released around the catheter to form an anti-infective environment to resist microorganisms, thereby preventing the propagation and migration of bacteria colonizing the catheter.

Medical Catheters are tubes that can inserted into a body cavity, vessel or duct, usually to allow for the administration of fluids, medications or gases or to drain fluids or urine from the body.

The Global Antimicrobial Coated Catheter Market Size was estimated at USD 1240.40 million in 2023 and is projected to reach USD 1861.50 million by 2029, exhibiting a CAGR of 7.00% during the forecast period.
