Abstracts

Antimony doped tin oxide (ATO) is a conductive ceramic material formed by doping tin oxide with antimony atoms, which introduces free charge carriers and imparts electrical conductivity while maintaining optical transparency in the visible spectrum. This n-type semiconductor is characterized by its high electrical conductivity, excellent chemical stability, thermal resistance, and infrared reflectivity, making it particularly valuable for applications requiring transparent conductive coatings, such as in displays, touchscreens, solar cells, and energy-efficient windows. Additionally, ATO nanoparticles are utilized as antistatic agents in plastics, textiles, and coatings, as well as in electromagnetic shielding and certain catalytic processes, leveraging its unique combination of electronic and optical properties derived from the strategic incorporation of antimony into the tin oxide lattice.
