Abstracts

Antimony oxide nanopowders are a specialized class of inorganic nanomaterials composed of ultrafine particles of antimony trioxide (Sb_2O_3) with at least one dimension in the nanometer range (typically $1\text{--}100\text{ nm}$), characterized by their high surface area-to-volume ratio, enhanced reactivity, and unique optical, electrical, and catalytic properties compared to their bulk counterparts. These nanopowders are primarily utilized as highly efficient flame retardant synergists in polymers, textiles, and electronics, where their nanoscale dispersion significantly improves fire suppression performance while allowing for lower additive loadings and better preservation of material mechanical properties; additional applications include their use as catalysts in chemical synthesis, opacifiers and UV blockers in coatings and ceramics, and as components in the manufacture of transparent conductive oxides and electrode materials for batteries and sensors.

The global Antimony Oxide Nanopowders market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
