### Report Overview

ATO (Antimony Tin Oxide) is a highly insoluble thermally stable Aluminum source suitable for glass, optic and ceramic applications. ATO is available in granule, powder and tablet forms. Oxide compounds are not conductive to electricity. However, certain perovskite structured oxides are electronically conductive finding application in the cathode of solid oxide fuel cells and oxygen generation systems. They are compounds containing at least one oxygen anion and one metallic cation. They are typically insoluble in aqueous solutions (water) and extremely stable making them useful in ceramic structures as simple as producing clay bowls to advanced electronics and in light weight structural components in aerospace and electrochemical applications such as fuel cells in which they exhibit ionic conductivity.

The global market for antimony tin oxide has been witnessing a noticeable increase owing to growing demand from its end-user industries. Electronics such as touch screen technology widely consume antimony tin oxide in their technology. Touch screens generally use antimony tin oxide in the touch system as well as in the LCD technology. Resistive touch screens which serve as an important segment in the market are usually constructed with two layers of electrically conductive materials antimony tin oxide or indium tin oxide, separated by insulated dots. In addition, capacitive touch screens are emerging as a high end version of the touch screen industry, specifically since the inception of iPhone by Apple Inc. which practices capacitive technology. However, resistive touch screen industry is expected to acquire majority of the shares in the touch screen industry. Use of antimony tin oxides in plastics as additives has been an important factor in the growth of the market. However, increasing regulations and environmental policies have been affecting the plastic industry due to which additive manufacturers have been under pressure to produce eco-friendly and safe chemicals.
