Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Antioxidant DSTDP competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The antioxidant DSTDP belongs to the thioester class of secondary antioxidants. It is a high-molecular-weight, low-volatile white powder or granules obtained by the esterification reaction of thiodipropionic acid with stearyl alcohol. When used in conjunction with a primary antioxidant, it significantly delays thermal oxidative aging of polymers during processing and use, exhibiting a synergistic effect. Therefore, it is widely used as a secondary antioxidant with excellent thermal stability. Global production in 2024 was estimated to be approximately 45,000 tons, with an average selling price of US\$3,340 per ton. The antioxidant DSTDP is primarily made from thiodipropionic acid and a fatty alcohol (stearyl alcohol). Thiodipropionic acid is the core acidic component of DSTDP, providing the sulfur structure. Stearyl alcohol, a long-chain fatty alcohol, reacts with thiodipropionic acid to form DSTDP. Manufacturers include Kao, BASF, and P&G Chemicals. As an excellent secondary antioxidant, DSTDP enjoys a wide range of downstream applications. The steady growth of industries like plastics and rubber has sustained market demand for DSTDP.

The global Antioxidant DSTDP market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
