Abstracts

The anti-reflective spectroscopic polarizer is a filter with special optical properties, which can decompose the incident light into polarized light with different vibration directions in two directions, and can selectively transmit light in certain wavelength ranges . Different from ordinary polarizers, anti-reflection and beam-splitting polarizers can have both anti-reflection and light-splitting functions. AR beam-splitting polarizers typically consist of multiple layers of films, each of which has been carefully engineered in thickness and index of refraction to achieve specific optical properties. These films can reflect, transmit, and interfere with the incident light, so as to achieve the functions of anti-reflection and light splitting. Anti-reflection spectroscopic polarizers are widely used in optical instruments, optical communications, optical displays and other fields. For example, the use of anti-reflection polarizers in microscopes can enhance the contrast of samples, making tiny structures more clearly visible; the use of anti-reflection polarizers in liquid crystal displays can achieve functions such as color filtering and light intensity control.

The global Antireflective Spectroscopic Polarizer market size was estimated at USD 285.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
