Abstracts

Antiviral drugs for influenza are medications specifically designed to inhibit the replication of influenza viruses within the body. These drugs help reduce the severity and duration of flu symptoms, lower the risk of complications, and, in some cases, prevent infection. Antiviral drugs for influenza are classified into different categories based on their mechanisms of action, including neuraminidase inhibitors (e.g., oseltamivir, zanamivir, peramivir), polymerase inhibitors (e.g., baloxavir marboxil), and M2 proton channel inhibitors (e.g., amantadine, rimantadine, though these are rarely used due to resistance). They are most effective when taken within 48 hours of symptom onset and are typically available by prescription.

The global Antiviral Drugs for Influenza market size was estimated at USD 96.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
