Report Overview

The acousto-optic Q-switch (AOQS) operates in a laser cavity and generates short-pulse, high-peak power lasers by actively controlling the Q factor of the cavity. AOQS is usually used to modulate the loss of the zero-order beam. When the RF drive of the AOQS is turned on, the zero-order light cannot form laser oscillation in the cavity due to diffraction, and the loss in the cavity increases, which hinders the laser output. When the RF drive is turned off for a short time, the optical power accumulated in the laser cavity is emitted in the form of pulses, generating pulsed lasers. This process can be repeated at a rate of more than 100KHz. AOQS can operate in the Bragg state, such as AOM (Acousto-Optic Modulator) with a single diffracted beam, or in the Raman-Nass state with multiple diffracted beams.
