Report Overview:

Aortic and peripheral vascular intervention devices are medical devices used to treat various conditions related to the aorta and the peripheral vascular system. These devices can be used to treat conditions such as aneurysms, stenosis, and other vascular abnormalities. Aortic intervention devices include stent grafts, which are used to repair aneurysms in the aorta. Stent grafts are typically made of a fabric tube supported by a metal frame, which is inserted into the damaged area of the aorta to reinforce the weakened walls and prevent rupture. Endovascular stent grafts are also used to treat aortic dissections and other conditions affecting the aorta. Peripheral vascular intervention devices include stents, which are small metal tubes that are used to prop open narrowed or blocked blood vessels. These devices are typically inserted through a small incision in the skin and guided to the affected area using imaging technology such as X-rays or ultrasound. Balloon angioplasty devices may also be used to widen narrowed or blocked vessels, by inflating a small balloon in the vessel to open up the narrowed area.

The Global Aortic and Peripheral Vascular Intervention Device Market Size was estimated at USD 2190.59 million in 2023 and is projected to reach USD 5282.17 million by 2029, exhibiting a CAGR of 15.80% during the forecast period.
