Abstracts

An Aortic Valved Graft (AVG) is a medical device used in cardiovascular surgery as a composite replacement for the aortic root and ascending aorta, integrating a prosthetic valve—either mechanical or biological—within a synthetic graft tube. This device is primarily indicated for conditions such as aortic root aneurysms, annuloaortic ectasia, acute aortic dissections, or failed native or prosthetic valves, where isolated valve replacement or graft placement is insufficient. The AVG allows for a single-stage repair, restoring both valvular function and structural integrity of the aorta, and is often used in procedures like the Bentall or modified Cabrol techniques to treat complex aortic pathologies, reduce reoperation risks, and improve hemodynamic outcomes.

The global Aortic Valved Graft (Avg) market size was estimated at USD 1260.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.65% during the forecast period.
