Report Overview

The APAP ventilator is a ventilator that automatically adjusts the airway pressure and is mainly used to treat sleep apnea syndrome (Sleep Apnea Syndrome, SAS). Different from traditional fixed-pressure ventilators, APAP-type ventilators can automatically adjust the airway pressure according to the patient's breathing conditions, providing more personalized and comfortable treatment effects. The APAP ventilator can detect the patient's breathing status through sensors, and adjust the airway pressure in real time to maintain the airway patency. When a patient's breathing becomes obstructed, the ventilator increases airway pressure to help the patient breathe. When the patient is breathing smoothly, the ventilator will automatically reduce the airway pressure to improve the patient's breathing comfort. The advantage of the APAP ventilator is that it can be adjusted according to the actual situation of the patient, thereby avoiding the discomfort of the patient from the fixed pressure and improving the comfort and effectiveness of the treatment. At the same time, the APAP ventilator can also record the patient's sleep breathing data to help doctors evaluate the treatment effect and formulate a personalized treatment plan.
