Abstracts

The APD chip is a high-performance photodetector that can provide high sensitivity and fast response under weak light conditions. When photons are irradiated onto the semiconductor material of the APD chip, electron-hole pairs are generated. Under high reverse bias, the generated electron-hole pairs gain sufficient kinetic energy under the action of a strong electric field, collide with lattice atoms, generate more electron-hole pairs, and form an avalanche multiplication effect, thereby amplifying the light signal. Through the avalanche multiplication effect, the APD chip converts the received light signal into an electrical signal and amplifies the signal. It is widely used in optical communications, lidar, security monitoring and other fields.

The global APD Chips market size was estimated at USD 162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
