Abstracts

An API for Carbon Footprint Calculations is a software interface that allows applications, platforms, or systems to programmatically estimate, track, and report greenhouse gas (GHG) emissions associated with various activities, products, or services. These APIs typically integrate standardized emissions factors, scientific methodologies (such as the GHG Protocol or ISO 14064), and real-time or historical activity data?such as energy consumption, transportation mileage, manufacturing output, or supply chain metrics?to compute carbon dioxide equivalent (CO₂e) values. By providing automated, accurate, and scalable calculations, a carbon footprint API enables businesses, developers, and sustainability platforms to embed environmental impact assessments directly into their workflows, dashboards, or customer-facing tools. In addition, many such APIs support multiple unit conversions, regional emissions datasets, and lifecycle analysis (LCA) approaches, making them essential for compliance reporting, ESG disclosures, and data-driven decarbonization strategies across industries.

The global API for Carbon Footprint Calculations market size was estimated at USD 783.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
