### Report Overview

Apomorphine is a non-selective dopamine agonist which activates both D2-like and, to a much lesser extent, D1-like receptors. It also acts as an antagonist of 5-HT<sub>2</sub> and  $\alpha$ -adrenergic receptors with high affinity. The compound is historically a morphine decomposition product made by boiling morphine with concentrated acid, hence the -morphine suffix. Apomorphine does not actually contain morphine or its skeleton, nor does it bind to opioid receptors.
