Report Overview

An Application-Specific Integrated Circuit (ASIC) is an integrated circuit (IC) customized for a particular use, rather than intended for general-purpose use. For example, a chip designed to run in a digital voice recorder or a high-efficiency Bitcoin miner is an ASIC. Application-specific standard products (ASSPs) are intermediate between ASICs and industry standard integrated circuits like the 7400 series or the 4000 series. Standard-cell based design is a process of designing the ASICs with digital-logic features and creates efficient blocks with electric characteristics such as capacitance and inductance. Utilizing this, the manufacture of ASICs is done with high density and good electrical performance. Moreover, the standard cell-based ASICs can be used by any manufacturer in any product, regardless of the design complexity. Additionally, a standard cell can also produce a cost-effective design with less manufacturing time and can be integrated with internet protocol cores and static random access memory effectively.
