Abstracts

Aquaculture wastewater treatment solution is a systematic combination of technologies designed to purify eutrophic substances (uneaten feed, feces, chemical agents, etc.) generated during the aquaculture process. Its core utilizes a three-stage process of physical filtration, biodegradation, and ecological purification to effectively remove suspended particles, ammonia nitrogen, nitrite, and organic pollutants from the water, enabling the recycling of aquaculture water or achieving compliant discharge. A typical process includes: primary separation of solid waste using microfilters or protein skimmers; cultivation of nitrifying bacteria using carriers such as biofilters and moving-bed biofilm reactors to convert toxic ammonia nitrogen into nitrate; and deep nitrogen and phosphorus removal using ecological methods such as constructed wetlands and algae cultivation. This system achieves precise control through water quality monitoring sensors and automatic dosing devices, significantly reducing the need for water exchanges and the risk of environmental pollution while ensuring the health of aquatic life, thus becoming a key technological support for achieving recirculating aquaculture and sustainable development.

The global Aquaculture Wastewater Treatment Solution market size was estimated at USD 393.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
