Abstracts

Aquarium cleaning bacteria, also known as beneficial or nitrifying bacteria, are live microbial cultures used in freshwater and saltwater aquariums to establish and maintain biological filtration by breaking down harmful waste compounds like ammonia and nitrites into less toxic nitrates. These bacteria colonize filter media, substrate, and other surfaces within the aquarium, forming a critical component of the nitrogen cycle that supports aquatic ecosystem health. Products in this market typically come in liquid, powder, or gel forms, often containing strains such as Nitrosomonas, Nitrobacter, or proprietary blends, and are marketed for both initial tank cycling and ongoing maintenance to prevent toxic buildup and promote water clarity.

The global Aquarium Cleaning Bacteria market size was estimated at USD 245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
