Abstracts

Aqueous Pu dispersion refers to a colloidal suspension of plutonium (Pu) particles, typically in the nanometer to micrometer size range, dispersed in an aqueous medium, often stabilized by surfactants or other chemical agents to prevent agglomeration and sedimentation. This specialized material is primarily utilized in nuclear research, fuel cycle development, and specific advanced nuclear applications, such as the fabrication of mixed oxide (MOX) fuels or as a precursor in sol-gel processes for producing ceramic nuclear fuels. Due to the extreme radiotoxicity, criticality risks, and stringent regulatory controls associated with plutonium, its handling, production, and use are highly restricted to authorized governmental, research, or industrial entities within the nuclear sector, making it a niche product with no commercial market in the conventional sense. The demand for aqueous Pu dispersions is driven by state-sponsored nuclear programs, academic research institutions, and national laboratories focused on advancing nuclear technology, fuel reprocessing, or waste management solutions, with production and supply almost exclusively managed under tightly controlled, secure frameworks to ensure non-proliferation and safety compliance.

The global Aqueous Pu Dispersion market size was estimated at USD 85.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
