Report Overview

AR Diffraction Optical Waveguide is an optical element that transmits, distributes, and refracts light by using diffraction phenomena. It consists of a series of parallel film gratings, core layers, and cladding layers. When the incident light passes through the grating, it will be freely transmitted in the core layer and diffracted on the grating, thereby realizing the branching and refraction of the waveguide. AR DOW is often used in augmented reality (AR) devices to distribute images to the user's eyes to achieve the characteristics of lightness, high definition, low power consumption and wearable.

The global Ar Diffraction Optical Waveguide market size was estimated at USD 85.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
