## Abstracts

An arc chute is a fence-like cover that covers the parts of equipment such as electrical switches or contactors that are prone to arcing. When an arc occurs, it will be elongated by the arc extinguishing grid, making the arc unable to be maintained and extinguished, thereby avoiding arc damage. In low-voltage circuit breakers (air switches), arc extinguishing grid is a widely used arc extinguishing method. It uses the principle of near cathode effect to divide a long arc into multiple short arcs. When the AC current crosses zero, due to the A higher initial dielectric strength appears immediately near the cathode. As long as the sum of the initial dielectric strengths of all series short arcs is greater than the applied voltage between the contacts, the arc will no longer reignite. This technology is also widely used in fire protection equipment in high-voltage power systems, electric vehicle battery packs, charging piles, solar photovoltaic power stations and other industrial fields. The arc quenching grid market is mainly affected by the increasing demand for electricity. With the continuous advancement of industrialization and urbanization, the demand for electricity continues to increase. The application of new materials, the use of digital technology and the development of intelligent control systems have brought new opportunities to the growth of the arc-extinguishing gate market. With the rapid development of smart grids, renewable energy and other fields, the demand for arc extinguishing grids will continue to increase. In conclusion, the development of the arc chute market is influenced by the increasing demand for electricity. In the future, with the rapid development of smart grids, renewable energy and other fields, the arc-extinguishing grid market will usher in broader development prospects.

The global Arc Chute market size was estimated at USD 410.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
