Report Overview

An arc chute is a fence-like cover that covers the parts of equipment such as electrical switches or contactors that are prone to arcing. When an arc occurs, it will be elongated by the arc extinguishing grid, making the arc unable to be maintained and extinguished, thereby avoiding arc damage. In low-voltage circuit breakers (air switches), arc extinguishing grid is a widely used arc extinguishing method. It uses the principle of near cathode effect to divide a long arc into multiple short arcs. When the AC current crosses zero, due to the A higher initial dielectric strength appears immediately near the cathode. As long as the sum of the initial dielectric strengths of all series short arcs is greater than the applied voltage between the contacts, the arc will no longer reignite. This technology is also widely used in fire protection equipment in high-voltage power systems, electric vehicle battery packs, charging piles, solar photovoltaic power stations and other industrial fields.

The global Arc Chute market size was estimated at USD 378 million in 2023 and is projected to reach USD 649.55 million by 2032, exhibiting a CAGR of 6.20% during the forecast period.
