Report Overview

Transformers for alternating current electric-arc furnaces (AC EAFs) are utilised throughout the steel industry. They are used to power arc furnaces for the production of steel, which require high levels of power that must also be variable due to the frequent short-circuits, and also to power arc furnaces for the production of special alloys – these alloys often require the deployment of three single-phase furnace transformers instead of a single three-phase transformer.

These transformers must be designed to resist the high levels of electrical, thermal and mechanical stress to which they are subject during utilisation.
