Abstracts

Arc suppression reactors, also known as Petersen coils or ground fault neutralizers, are specialized inductive devices used in three-phase electrical power systems to limit fault current during a single-line-to-ground fault by compensating for the system's capacitive charging current, thereby preventing sustained arcing, reducing insulation stress, minimizing equipment damage, and enhancing system reliability and safety, particularly in ungrounded or impedance-grounded networks where they are engineered to resonate with the system capacitance to effectively suppress arc formation and extinguish ground faults.

The global Arc Suppression Reactors market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
