Report Overview

Excimer refers to a condition where molecular elements are in a highly excited and unstable state. Normally, atoms and molecules move with a specific energy. If they receive extra energy from an external source, these atoms and molecules move with higher energy. This is called an excited state. After a while the atoms and molecules release this extra energy and return to their normal energy state. When this happens, the released energy is transformed into light. This process is called 'spontaneous emission.' When this light collides with other atoms and molecules that have high energy, light with the same properties is emitted. This is called 'stimulated emission.'
