Abstracts

ArF photoresist monomer is the basic component of photoresist. Through the action of photosensitizer, it polymerizes into macromolecules under ultraviolet light irradiation to form the structure of photoresist. Specifically, the types of different photorettic glue have corresponding photoresistic glue monomers. For ARF lithography, its monomers mainly include methyl acrylate and derivatives of acrylic. Under the influence of photochemical agents, polymerization reactions will occur under ultraviolet light, forming a polymer with large molecular weight. These polymers have good light sensitivity and film formability. Material. According to the SEMI report, the semiconductor materials market will grow by 8.6% in 2022, hitting a new high of US\$69.8 billion in market size. Since semiconductor materials are an industry with high technical barriers, most high-end products of semiconductor materials are currently concentrated in the United States, Japan, Germany and other countries and regions. From a demand perspective, Taiwan, China, South Korea, Japan, and the United States are the world's largest semiconductor material markets, accounting for more than 80% of the global market. With the shift of the semiconductor industry, the global semiconductor materials industry has also experienced a shift of center of gravity from west to east. China's semiconductor materials market is the fastest growing region in the world. In 2022, the United States will introduce new regulations to sanction China's advanced semiconductor process industry. This will have a certain impact on all aspects of China's integrated circuit manufacturing industry in the short term. However, in the long term, China's integrated circuit industry will inevitably will embark on the road of independent innovation.

The global ArF Photoresist Monomer market size was estimated at USD 455.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
