Report Overview

The core component of the spectrometer is the diffraction grating, which is responsible for splitting the beam to be analyzed into spectral components and then projecting them onto the detector. This allows the energy level of individual wavelengths to be assessed. The detector array collects the entire spectrum simultaneously, so measurement times are extremely short, down to milliseconds. Array spectrometers are widely used in laboratories because of their versatility. In addition, array spectrometers are robust and have high luminous throughput, making them ideal for light measurements in industrial applications, for example, for the production of individual LEDs and various types of displays.
